

GAMES AND TOURNAMENT 10-09-2026

Directions for questions 1 to 5: Answer these questions on the basis of the information given below.

27 players who participated in a Table Tennis tournament are ranked from 1st to 27th. Byes are given to the top ranked players in the first round in such a manner that there are no more byes in further rounds.

The matches are played in the first round such that the highest ranked player (except those who got byes) plays with the lowest ranked player and the second highest ranked player plays with the second lowest ranked player and so on. The winners of the first round move to the second round.

In the second round, the player ranked 1 plays with the winner of the last match of the first round, the player ranked 2 plays with the winner of the second last match of the first round and so on.

Note: A lower ranked player beating a higher ranked player is called an upset. No match ended in a draw.

Directions for questions 1 to 4: Type in your answer in the input box provided below the question.

What is the total number of matches in the tournament?

Solution:

The total number of matches in the tournament is one less than the number of players
i.e., 26. Ans : (26)

Directions for questions 1 to 4: Type in your answer in the input box provided below the question.

How many players got a bye in the first round?

Your Answer: Unattempted

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

The number of players who got bye in the first round is the difference between the number of players and the next higher power of 2, i.e. $32 - 27 = 5$ Ans : (5)

Directions for questions 1 to 4: Type in your answer in the input box provided below the question.

If the 12th ranked player plays in the semi-finals with the 17th ranked player, what is the minimum number upsets in the tournament?

Your Answer: Unattempted

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

If the 12th ranked player reaches the semi-finals, the matches he played in the second round and the quarterfinal resulted in an upset. Similarly if the 17th ranked player reaches the semi-finals, the matches he played in the first, second and quarterfinals resulted in upsets.
Ans : (5)

Directions for questions 1 to 4: Type in your answer in the input box provided below the question.

If there were exactly two upsets in the whole tournament, what is the rank of the lowest seeded player the 4th ranked player can play against, in the semifinals?

Your Answer: Unattempted

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

If there were exactly two upsets in the tournament those upsets can result only during the quarterfinal and the second round. The lowest seeded player whose match can result in upset in those two rounds is 16th ranked player.

Ans : (16)

Directions for question 5: Select the correct alternative from the given choices.

If the 17th ranked player reached the finals, who amongst the following definitely did not reach the finals?

- ☐ a) 25
- ☐ b) 11
- ☐ c) 18
- ☐ d) None of the above

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

If the 17th ranked player reaches the finals, only those players can reach the finals who do not play with the 17th ranked player in the previous rounds.
As, 17th ranked player has defeated players he played with in the previous rounds, those players can be 16 (first round), 1 (second round), 8, 25, 9, 20 (quarter finals), 4, 5, 12, 13, 20 or 21 (semi-finals).
The rest of the players definitely did not play against him in the previous rounds. So 18th and 11th ranked players could have reached the finals. Choice (A)

Directions for questions 6 to 10: Answer these questions on the basis of the information given below.

10 players A through J participated in a carrom tournament. The players were divided into two groups of five players each. Each player had to play exactly once with every other player in the same group and the points were awarded as follows - Win = 2 points; Draw = 1 point; loss = 0 points. At the end of all the matches in the group stage, the players are ranked from 1 to 5 in each group, based on the points they scored.

The winners (the player with the highest points) of the two groups played the final match and the winner of the final match was declared the winner of the tournament. No two players in a group scored the same number of points. The tables give partial information about the points scored by different players against other player in the same group. For example – C scored 2 points against E.

	A	B	C	D	E	Points	Rank
A						1	
B							
C					2	7	
D		1					3
E	1	0				2	

	F	G	H	I	J	Points	Rank
K						2	
G			1			4	
H	0						5
I					0		
J		2					

How many points did the winner of group II score?

- ☐ a) 8
- ☐ b) 7
- ☐ c) 6
- ☐ d) 5

Solution:

Filling the tables I with the given information we get

	A	B	C	D	E	Points	Rank
A		0	0	0	1	1	
B	2			1			
C	2				2	7	
D	2	1					3
E	1	0	0			2	

B can have a maximum of 6 points as his match with D resulted in a draw and C has 7 points. So, D can have 4 points as the total number has to be 20. Therefore, C is ranked 1st, B 2nd, E 4th and A is ranked 5th.

The final table can be as follows.

	A	B	C	D	E	Points	Rank
A		0	0	0	1	1	5
B	2		1	1	2	6	2
C	2	1		2	2	7	1
D	2	1	0		1	4	3
E	1	0	0	1		2	4

Filling table II with given information, we get

	F	G	H	I	J	Points	Rank
F		0	2	0	0	2	
G	2		1			4	
H	0	1					5
I	2				0		
J	2	2		2			

As H is the 5th ranked player and F has 2 points, H can have 1 point only. The final table is

Filling table II with given information, we get

	F	G	H	I	J	Points	Rank
F		0	2	0	0	2	
G	2		1			4	
H	0	1					5
I	2				0		
J	2	2		2			

As H is the 5th ranked player and F has 2 points, H can have 1 point only. The final table is

	F	G	H	I	J	Points	Rank
F		0	2	0	0	2	4
G	2		1	1	0	4	3
H	0	1		0	0	1	5
I	2	1	2		0	5	2
J	2	2	2	2		8	1

The winner of group II scored 8 points.

Choice (A)

What was the result of the match between D and C?

- ☐ a) D won the match
- ☐ b) C won the match (Correct Answer - ✓)
- ☐ c) Match ended in a draw
- ☐ d) Cannot be determined

Which player who won the maximum number of matches in the group stage?

- ☐ a) C
- ☐ b) B
- ☐ c) I
- ☐ d) J (Correct Answer - ✓)

How many matches in the tournament ended in a draw?

☐ a) 6 (Correct Answer - ✓)

☐ b) 3

☐ c) 5

☐ d) 7

How many players teams did not win even a single match?

☐ a) 0

☐ b) 1

☐ c) 2

☐ d) 3 (Correct Answer - ✓)

Directions for questions 11 to 15: Answer these questions on the basis of the information given below.

A and B play a game in which n coins are placed on a table. Each player picks at least 3 coins and at most 6 coins in his/her turn unless there are less than 3 coins in the table in which case the player has to pick all the coins left. A and B play intelligently so as to win the game.

For questions 11 and 12, assume the person who picks the last coin loses the game.

If $n = 77$, how many coins should A pick to ensure his win if he starts the game?

☐ a) 3

☐ b) 4

☐ c) 5

☐ d) Either A or B (Correct Answer - ✓)

Solution:

If $n = 77$, A has to pick such number of coins that the number of coins left is of the form $9k + 1$, $9k + 2$ or $9k + 3$. Therefore, he can pick 2, 3 or 4 coins.

Choice (D)

Which of the following can be the number of coins on the table before A's turn to play, if it is known that B is going to win the game, no matter how many coins A picks?

- ☐ a) 100
- ☐ b) 150
- ☐ c) 200
- ☐ d) More than one of the above

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

For B to win the game when it is A's chance to pick, the number of coins should be of the form $9k + 1$, $9k + 2$ or $9k + 3$. i.e., 100 or 200.

Choice (D)

If $n = 173$, how many coins should B pick to ensure his win, if he starts the game? Assume the person who picks the last coin wins the game.

- ☐ a) 1
- ☐ b) 3
- ☐ c) 5
- ☐ d) 6

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

If $n = 173$, B has to pick such number of coins that the number of coins left for A is of the form $9k$, $9k - 1$, $9k - 2$. So, B can pick 3 coins.

Choice (B)

Which of the following can be the number of coins on the table before B's turn to play, if it is known that A is going to win the game, no matter how many coins B picks?

Assume the person who picks the last coin wins the game.

- ☐ a) 263
- ☐ b) 157
- ☐ c) 124
- ☐ d) 78

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

For A to win the game, the number of coins left for B must be of the form $9k$, $9k - 1$ or $9k - 2$, 124 is of the form $9k - 2$.
Choice (C)

If it is known that B picked four coins in his turn and won the game, which of the following was the number of coins on the table before B picked the four coins?

Assume the person who picks the last coin wins the game.

- ☐ a) 76
- ☐ b) 82
- ☐ c) 86
- ☐ d) More than one of the above

Show Correct Answer

Hide Solution

PREVIOUS

NEXT

Solution:

As the number of coins after B's turn is of the form $9K$, $9K - 1$ or $9K - 2$, before his turn it was of the form $9K + 4$, $9K + 3$ or $9K + 2$. Only choice (A) satisfies.
Choice (A)
